RGB VISION

A speedrun platformer — Jam for All BASIC Dialects #7

CONTROLS

← →	Move left / right
↑	Jump
SPACE	Cycle vision mode (GREEN → RED → BLUE)
ESC	Quit to main menu

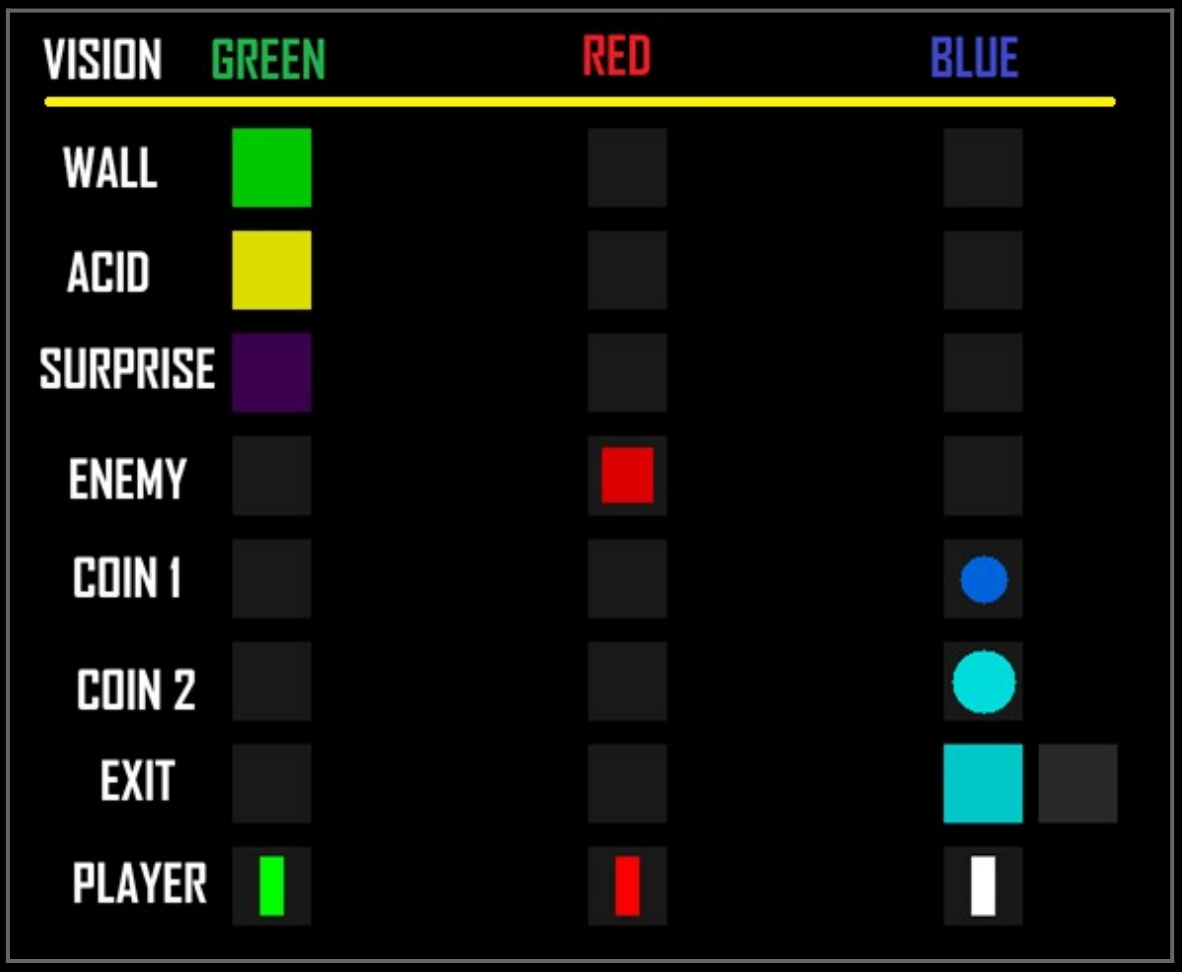

VISION MODES

The world is in darkness. You carry a small light cone — but no single mode reveals everything. You must constantly cycle between three vision modes to navigate, avoid enemies and find the exit.

GREEN MODE	Shows walls, open space, acid tiles and surprise tiles. Use this to navigate the level structure.
RED MODE	Reveals enemies. Enemies patrol left and right — they kill on contact regardless of which mode you are in. Switch to RED to see where they are before moving through.
BLUE MODE	Shows coins, the exit and your spawn point. Collect ALL mandatory coins before the exit becomes active.

TILE REFERENCE

The tiles below are shown as they appear in-game across the three vision modes

RULES

- Hitting acid or an enemy will kill you instantly and you must start current level
- Coin 1 is optional to collect. Reduces your game time by 0.2 seconds each
- Coin 2 is mandatory to collect before exit
- Exit color changes from dark grey to cyan when you have collected all mandatory coins
- No saving, pausing, etc. Game must be played through in one go

SCORING & TIME

Your goal is to complete all 10 levels as fast as possible. The timer runs from the moment the first level starts until you step through the final exit. Each optional coin you collect reduces your final time by 0.2 seconds. Mandatory coins do not give a time bonus but must be collected to open the exit. Your best time is saved automatically and shown on the main menu.

HACKING

The record result is recorded in a way that requires minimal programming skills to hack.

A top-notch result shown on screen without, for example, video proof doesn't really guarantee anything ;)

TIPS

- Enemies move even when you cannot see them — check RED mode before crossing open ground.

- Surprise will do something good or bad, but will never kill you

- All levels are same each time, except the starting direction of enemies is random

- The coins may just be there to entice you to waste time collecting them.

- Timer start right after you choose *"New Game"* from menu

- You can jump and move in any vision mode. Mode only affects what you see, not what the world does to you.

COPYRIGHT

This game and all its content is produced by Kristian Virtanen unless otherwise stated.

While developing the game, I have also developed the BazzBasic-AI-Guide.md guide, which is intended as a reference for modern artificial intelligence — allowing it to either write BazzBasic code itself or guide its user to doing so.

In some respects, the code is also written by Claude.ai, as testing the guide has required this.

However, the idea, levels, functions and a significant part of the code are the author's own work.

The game is implemented with the BazzBasic 1.0 interpreter and is available in executable form at ek-bass.itch.io/rgb-vision

Images, sounds and other attachments are subject to their respective licenses. You can find more information about these by reading the file *credits.txt* in the root of the game.

Footnote

Im sorry I had no more time to work with this. Duties and work keeps me busy, but it was fun to write the first real BazzBasic game even the timeframe was a bit too short.
